

## 2011 Corn Trait Selection:

# Which Insect Traits Do You Need?

Joe Bollman, Columbia County UWEX and Richard Proost, UW Nutrient and Pest Management Program

The number of traits stacked into individual transgenic corn hybrids is increasing every year. With the increasing complexity comes the risk of ordering unnecessary traits. Planting the right “stack” for a particular farm with the correct insect control package is challenging.

The table summarizes the current available insect packages in increasing order of “stacked” traits. *This table only considers control of individual insect pests, not suppression.*

- Refer to seed tag for insect refuge requirements, location or herbicide tolerance.
- Read and follow the seed tag and user agreements for insect resistance management (IRM).
- Rotate Bt proteins for resistance management.

University of Wisconsin-Extension, College of Agricultural and Life Sciences. An equal opportunity action employer, University of Wisconsin-Extension provides equal opportunities in employment and programming, including Title IX requirements.
